

Individual Reflection

In the making of this project, me and my team really learned alot, through all the hard times making this project, this project taught us so much like proper Programming and Computer ethics such as encryption awareness which helps keeps users privacy safe, it taught us to always double check our work as even just a single mistake, a single letter, a single number wrong, then all our hard work will be for nothing, it also taught us important foundation python skills as now we are fluent in the python language such as in for and while loops along with the built-in data structures such as dictionaries and tuples but we used what we learned to get past these challenges and emerge smarter. In conclusion, this CS project really helped me and my groupmates grow as a person becasue it taught us really important skills in the coding language of Python and more.
